DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 1-26-04 has been entered.

Response to Arguments

2. Applicant's arguments with respect to claims 8-14, and 58-72 have been considered but are most in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 112

- 3. The following is a quotation of the second paragraph of 35 U.S.C. 112:
 The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 4. Claims 8-14, and 58-72 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The instant claims are drawn to a method of assigning a function to a product coded for by a nucleotide sequence of a sample nucleic acid, wherein said method comprises, "in the resulting host cells, analyzing phenotypic changes to thereby identify a corresponding change in function, whereby, based upon the corresponding change in function, a function is assigned to the product encoded by the nucleotide sequence of the sample nucleic acid."

Art Unit: 1635

The metes and bounds of the claimed method are vague and indefinite because the purpose of the method states "a method of assigning a function to a product," based upon the last step in the method, it appears that the function is already known since it recites "analyzing phenotypic changes to thereby identifying a corresponding change in function." In order to identify a change in function, the original function must be previously known in order to know that there was a change in function. Moreover, Applicant's method recites that the coding sequences for each individual transcription product encodes an antisense nucleic acid that, when expressed as RNA, binds to mRNA transcribed from the target nucleic acid molecule that comprises the nucleotide sequence of the sample nucleic acid. It is not clear that the recited antisense nucleic acid has a structure that causes specific binding to the mRNA transcribed from the target nucleic acid, such that the inhibition of one of the products of the mRNA is directly correlated to a change in phenotype of the resulting host cells.
